

A DermaTouch™ treatment is Safe and Effective

All people, men and women alike, share a common desire to look their best regardless of their age. Many options, including chemical and laser treatments or drug therapies may be inconvenient, invasive, or just too expensive. *DermaTouch* microdermabrasion technology, however, is an affordable and simple way to give you healthier, younger-looking skin.

Integrated Technology ~ Progressive Skincare

DermaTouch microdermabrasion complements most treatment programs. Without interference, it provides a gentle, effective peeling of the outer layer of the skin.

A *DermaTouch* treatment is quick and pain-free. There are virtually no side effects, and it leaves little or no redness. It helps to minimize many skin conditions or to refresh and maintain the health of the skin. Treatments take less than an hour and normal activities can be resumed immediately.

Frequently asked questions About microdermabrasion:

How does microdermabrasion compare to a chemical peel?

- No post molting of peeling of the skin.
- No excessive redness or days of downtime.
- No uneven results.
- DermaTouch microdermabrasion is painless.
- You get immediate and consistent results with microdermabrasion.

How quickly can I put on my makeup? In most cases within a few minutes after the treatment. Many women find they use less makeup after microdermabrasion.

How will my face feel afterwards? Immediately after completion you may feel a bit “wind-burned” for a short time.

What other skin can be rejuvenated with microdermabrasion? Neck, chest, hands, elbows, arms, knees, and back can all be successfully treated.

Note: Results will vary. During your initial consultation, your skincare specialist will evaluate your age, skin type, and skin condition. She will recommend a personalized treatment plan and homecare products for maximum results.

MICRODERMABRASION

*Microdermabrasion gently restores
a younger complexion*

Learn how it may be right for you.

How *DermaTouch* Works

Microdermabrasion was developed from dermabrasion, a treatment in use for generations. *DermaTouch* microdermabrasion is a more gentle technique. Tiny crystals are sprayed on the skin and suctioned back up into the machine, along with loosened skin. The pressure can be varied to control the level of exfoliation. The skin is left smooth, refreshed, and rejuvenated.

A DermaTouch treatment Will Help You Look Great!

- Even skin tone
- Good skin color
- Smaller skin pores
- Improve acne
- Reduce fine lines
- Increase elasticity
- Softer skin
- Lighten age spots
- Reduce fine lines
- Healthy appearance

The Key to a Smoother Skin Surface

A *DermaTouch* treatment removes epidermal layers at varying depths in a safe, controlled manner. The integrity of the skin is respected and consistent healing is promoted. Insuring level cellular growth on the surface increases the youthfulness of the skin's appearance.

The skin surface is renewed on average every 10 days. However, cell renewal may be much slower with age, poor health, or lack of care. Regular microdermabrasion treatments improve many skin conditions and imperfections, to create a healthy, balanced skin surface.

Microdermabrasion and New Cellular Growth

Microdermabrasion removes the dead, outer layer of skin cells and promotes the formation of new cells at the dermis and epidermis levels to improve skin appearance overall.

Cellular regeneration and epidermal growth are influenced by many factors. For example, the skin's natural response to excessive sunlight is to become thicker. This can result in slower shedding and dry, rough skin. Acne sufferers may retain their skin cells, causing further congestion and thickening of the top skin layer.

Other factors including age, genetics hormone balance, lack of minerals, and inadequate diet, influence epidermal cellular turnover and the production of new, healthy cells.
