Estheticians

Learn the
Art & Science
of Oxygen Skin Care

What does topical oxygen do for your skin?

- Improve skin's basic function
- Enhance production of collagen, elastin and water holding substances
- Promotes healing while reducing bacteria levels

Younger looking, more radiant skin

Oxyvital provides
Education and Certification

Oxygen Facial Infusion

Hydrosols

By Dr. Craig Wenborg

Hydrosols are the liquid constituents of the plant, released during the extraction process.

Hydrosols are placed in the nebulizer and infused directly into the skin.

Hydrosols act as a coupling medium. During treatment, oxygen rich hydrosol is carried deep into the epidermis.

Plant phytochemicals contained within the hydrosol, have therapeutic properties. Hydrosol formulations are mixed for the synergistic properties of the plant. The combined effects of natural oxygen and plant hydrosols provide a balanced, natural approach to skin care.

New to the science of skin care are Peptides. Peptides have been shown to be effective in reducing fine lines and wrinkles. Oxyvital Anti-Aging hydrosols contain both plants and peptides.

The Oxyvital P6000 Oxygen Concentrator

The Oxyvital P6000 is the Roles Royce of the industry. The American made compressor provides superior outflow pressure to drive the infusion process. Three sieve design assures consistent 95% oxygen outflow concentration.

You will appreciate the *quiet nature* of the Oxyvital P6000.

The Oxyvital P6000 is operator friendly and easy to use. The front of the machine has a digital display to provide constant information on the machine functions. The P6000 is warranted for one year on defects that are due to improper materials or manufacturing defects.

Nebulizer Infuser

Oxyvital uses the highest quality nebulizer available.

Within the nebulizer, *a tornado effect* creates very

fine particles of the hydrosol solution.

These hydrosol particles are *supercharged with oxygen* and infused deep into the epidermis.

The Oxyvital system is perfectly balanced for flow and pressure. This allows greater *oxygen-to-skin contact time*, without overflowing.
